S00670
neurogenic repetitive locus delta protein precursor - fruit fly (Drosophila me neurogenic repetitive locus delta protein
N.Alternate names: gene Dl protein
C.Species: Drosophila melanogaster
C;Date: 31-Dec-1988 #sequence_revision 31-Dec-1988 #text_change 09-Jul-2004
C;Accession: S00670, A26637
R;Vaessin, H.; Bremer, K.A.; Knust, E.; Campos-Ortega, J.A.
EMBO J. 6, 3431-3440, 1987
A;Title: The neurogenic gene Delta of Drosophila melanogaster is expressed in A;Reference number: S00670
A;Accession: S00670
A;Accession: S00670
A;Accession: S0670
A;Molecule type: mRNA
A;Residues: 1-880 < VAE>

Nylternate names: Notch homology

Cyspecies: Mus musculus (house mouse)

Cybate: 21-Jan-1994 #sequence revision 05-Jan-1996 #text_change

Cybatesion: A49175; PH1570; S32113

Rylardelli, W.; Lendahl, U.

Exp. Cell Res. 204, 364-372, 1993

A7Title: Motch A and Motch B--two mouse Notch homologues coexpre

A, Reference number: A49175; MUD: 93178563; PMID: 8440332

A, Accession: A49175

A, Residues: preliminary; nucleic acid sequence not shown

A, Molecule type: mana

A, Roserimental source: embryo

A, Experimental source: embryo

A, Note: sequence extracted from NCBI backbone (NCBIP: 12615)

A, Cromment: This protein has many EGF repeats and lin-1

C, Comment: This protein has many EGF repeats and lin-1

Bettenhausen B., de Angelis M.H., Simon D., Guenet J.-L., Gossler A.;

Transient and restricted expression during mouse embryogenesis of

Dll1, a murine gene closely related to Drosophila Delta.";

Development 121:2407-2418(1995).

-!- FUNCTION: May be involved in cell-to-cell communication in mammalian embryos. May have a role in cellular interactions

C -!- FUNCTION: May be involved in cellular interactions

C -!- SUBCULIVIAR LOCATION: Type I membrane protein.

-!- SUBCELLULAR LOCATION: Type I membrane protein.

-!- TISSUE SPECIFICITY: In the embryo, expressed in the paraxial mesoderm and nervous system. Expressed at high levels in adult heart and at lower levels, in adult lung.

-!- DEVELOPMENTAL STAGE: Expressed until day 15 in the embryo.

Expression then decreases and increases again in the adult.

-!- SIMILARITY: Contains 8 EGF-like domains.
                                                                                                                                                                                                                                      |||:|

M-Delta-1 Mouse not

M-delta-1 polypeptide (AAW11720) is the mouse homologue of Drosophila Delta, a protein that binds to Notch protein. It is expressed primarily in presomitic mesoderm, the central and peripheral nervous systems, and kidney. Chick (AAW11719) and human (AAW11721- 38) Delta-1 polypeptides have also been identified. Delta-1 proteins can be used to treat or prevent disorders characterised by increased Notch activity, such as cervical, breast, lung or colon cancer, melanoma or seminoma, as well as nervous system disorders, and to promote tissue regeneration and repair

The invention relates to modulating the differentiation of an embryonic stem cell; comprising: (a) providing a culture of embryonic stem cells; (b) providing at lease one ligand or its active binding fragment, capable of binding its cognate receptor polypeptide expressed by the embryonic cream cells, comprising an culture comprising embryonic stem cells and the ligand; and (d) growing a culture comprising embryonic stem cells, comprising (a) providing a culture comprising caid endealed are: (i) indiang the differentiation of embryonic stem cells, comprising; (a) providing a cell transfected with a mucleic acid sequences; (ii) an uncleic acid molecule which are applied of modulating embryonic stem cell; and which encodes a ligand capable of modulating embryonic stem cell; and (d) with an embryonic stem cell; and (d) growing the culture for the maintenance and/or differentiation of the embryonic stem cell; and (d) growing the culture for the maintenance and/or differentiation of the embryonic stem cell; in an undifferentiate are inhibitors of the maintenance of embryonic stem cells; and (c) growing the culture for the maintenance and propagated or its active comprising the cells; and (c) growing the cell; and (c) growing the cells; and (c) growing the cells; or comprising the cells; and (d) with an and differentiated erace; or (i) Inhibiting peth differentiation of embryonic stem cells; or comprising the cells; and (e) growing a culture for the maintenance of embryonic stem cells in an undifferentiated erace; or (i) Inhibiting with the signalling; and inhibitors of the methods cited above. The therapeutic cell of the comprising the cell identified in (a) with an embryonic stem cells or comprising the cell identified in (a) with an embryonic stem cells or cell and or or the sequences of (i) or (ii) the therapeutic cell or cell or cell or cell or cell or methods cited above. The therapeutic cell or cell or cell which have been induced to differentiate into an induced to differentiate in the present invention is use
                                                                                                                                                                                                                                                                                                                                                                 cells by providing
                                                                                                                                                                                                                                                                                                                                                                 Modulating the differentiation of embryonic stem cells by providing ligands which bind receptors in the Notch and Wnt pathways, useful treating diseases such as Parkinson's, Huntington's, heart disease, diabetes and AIDS.
                                                                                                                                                                                                                                                                     ď

The present invention relates to a novel screening method which enables the identification of biologically active agents which mediate their effect through the activation of genes. The method involves providing a population of cells stably transfected with a nucleic acid encoding a reporter molecule, cloning the transfected with a nucleic acid encoding a reporter molecule, cloning the transfected with a nucleic acid encoding a caporter molecule as a result of exposure to the signal generated by the reporter molecule as a result of exposure to the agent. The method is useful in identifying biologically active agents and the genes through which the agents act, in screening potential drugs for their ability to activate certain drug targets in a high-throughput assay, in identifying relationships between signalling pathways and specific signals that could be useful in eventually directing the differentiation of embryonic stem cells and in toxicology assays by testing for unwanted activation or inhibition of specific signalling pathways. The present sequence is murine notch ligand delta-like I protein used to illustrate the method of the invention
                                                                                                                                                      and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180

liagnosis, 18 system, ซ central nervou New cleavage peptide, nucleic acids and antibodies useful for prevention and treatment of cancer, disorders of central nervo cirrhosis and psoriasis

3; 177pp; English. Claim 1; Fig This sequence represents the murine delta protein amino acid sequence.

C Delta is a toporythmic protein that contains a sequence which is cleaved

C by the metalloprotease-disintigrin Kuzbanian (Kuz). Cleavage by Kuz

C results in two fragments, a soluble amino terminal fragment consisting

C sesentially of the extracellular domain, and a membrane bound fragment

C consisting of the transmembrane domain and the intracellular domain. The

soluble fragment is able to bind to Notch. Delta plays a key role in

differentiation, and therefore detection and measurement of delta

activation is important in the study of differentiation. The invention

C relates to the delta cleavage peptides (the active fragment), and to

methods for detecting and measuring delta activation. Delta cleavage

C methods for detecting are useful for modulating the activity of

Notch, delta or kuz or at least one of the signalling pathways in a cell

Or or organism, expressing Notch. By contacting a cell with kuz protein or activity of in a cell

nucleic acid or its antibody, the activity or levels of delta protein is modulated and vice versa. A delta cleavage peptide or its derivative capable of binding kuz protein is useful for treating or preventing a disease or disorder associated with increased delta activity or expression such as cervical, breast, colon or lung cancer, melanoma or seminoma in humans. A recombinant cell comprising a delta peptide is useful for treating or preventing central nervous system disorders. A delta cleavage peptide is useful for the diagnosis of diseases or disorders associated with increased levels of Notch-delta protein binding activity comprising measuring the ability of delta cleavage peptides in a sample to bind kuz protein. A complex of delta protein and kuz is useful for diagnosing or screening for the presence of, or predisposition to developing a disease or disorder associated with aberrant levels of the complex, comprising measuring the level or functional activity of the complex, comprising measuring the level or functional activity of the complex or RNA encoding delta or kuz in a sample. The delta cleavage peptide is also useful for promoting tissue regeneration and repair, for treating liver cirrhosis, keloid formation, psoriasis, baldness and degenerative or traumatic disorders of the sensory epithelium of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 480

                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a polypeptide which suppresses proliferation and differentiation of undifferentiated cells such as neurons and blood cells. The polypeptide may be used for the prevent and control of disorders involving undifferentiated cells, such as leukaemia and malignant tumours, and improvement of blood formation, after immunosuppression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                    This sequence represents the human delta-1 protein, which is a ligand of the human notch protein. The protein or fragments, especially AAW75493-W75495, can be used as a drug to control vascular cells. The sequences were isolated and the truncated fragments were generated using the primers AAX16818-X16831

The present invention describes full length and shortened human delta-2 proteins. Human delta-2 is a differentiation inhibitor which inhibits the differentiation of undifferentiated cells (other than brain or muscle cells), such as blood cells, and enhances the proliferation of undifferentiated blood cells. Products of human delta-2 may be used for the treatment of diseases such as leukaemia and malignant tumours. They may also be used in the culture of human cells in vitro, e.g. for production of supplies of undifferentiated blood cells. The present sequence represents human delta-1, from an example of the present

The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, Sjogren's systemic solerosis, idiopathic inflammatory myopathies, Sjogren's systemic succlimmune thrombocytopaenia, thyroiditis, diabetes mellitus, anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems, hepatobiliary diseases, inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune cor immune-mediated skin diseases, allergic diseases, immunological diseases of the lung, and transplantation associated diseases including graft rejection and graft-versus-host-disease. AACS8397 to AACS8378 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AACS8579 to AACS8642 and AAB33414 to AACS8577 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            rheumatoi

                                                                                                                                                                                                                                                                                                                The present invention describes nucleic acids encoding PRO polypeptides useful for preventing, diagnosing and treating diagnosing a cardiovascular, endothelial or angiogenic disorder in mammals by modulating cell proliferation, angiogenesis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA77721 and AAB24338 to AAB24435 represent nucleotide and protein sequences used in the exemplification of the

Isolated PRO211, PRO228, PRO538, PRO172 or PRO182 polypeptides or their agonists (preferably anti-PRO agonist antibody or a small molecule mimicking the biological activity of PRO polypeptide) are useful in vitro or in vivo for inhibiting the growth of a tumour cell. Compositions comprising the PRO polypeptides are useful for inhibiting neoplastic cell growth and for treating cancer including breast, ovarian, renal, colorectal, uterine, prostate, lung, bladder, central nervous system cancer, melanoma and leukaemia in a mammal. The PRO polypeptides are also useful for treating other disorders such as neuronal, glial, astrocytal, hypothalamic and other glandular, macrophagal, epithelial, stromal, blastocoelic disorders and inflammatory, angiogenic and immunologic disorders as well as being useful for identifying agonists to PRO polypeptides by contacting the polypeptide with a candidate molecule and monitoring biological activity mediated by the polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               119

AAU12172-AAU12446 represent novel human secretory and transmembrane PRO polypeptides. The PRO polypeptides are useful to detect other PRO polypeptides, to link bioactive molecules to cells expressing PRO polypeptides, to link bioactive molecules to cells expressing PRO polypeptides, and to detect the presence of mammalian lung, colon, breast, prostate, rectal, cervical or liver tumours by comparing PRO polypeptide expression in a cell sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, the proliferation or differentiation of chondrocytes, the proliferation or gene expression in pericyte cells, the release of proteoglycans from cartilage, the proliferation of inner ear utricular supporting cells or of T-consistential cells, the release of a cytokine from peripheral blood monocytes (PBMCs), or the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide to factor vila. The PRO polypeptides can be used to generate probes, antisense RNA/DNA, transgenic or knock out animals and can be used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Some
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated , secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bioactive molecules to cells expressing PRO polypeptides, and detect the presence of mammalian tumors e.g. lung, breast, prostate, cervical.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     59
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        3

The invention relates to novel human angiogenesis-associated proteins designated PRO proteins (AAB53064-B53097), and to nucleic acids encoding PRO proteins. The invention also relates to vectors and host cells comprising a PRO nucleic acid, the recombinant production of a PRO protein, PRO antibodies specific for a PRO protein, fusion proteins comprising a PRO nucleic acid, and antagonists of a PRO protein, and comprising a PRO protein, and additionally encompasses methods of identifying modulators of PRO additionally encompasses methods of identifying modulators of PRO additionally encompasses methods of identifying modulators of PRO expression or a susceptibility to such a disorder by detecting mutations in a PRO gene, the administration of a PRO protein, and otherlial or angiogenic disorder via the administration of a PRO protein, PRO nucleic acid, and methods of inhibiting or stimulating endothalial and protein and PRO administration of a PRO protein, and proteins, PRO nucleic acids, PRO proteins, and proteins and PRO proteins, and proteins, and proteins, and proteins and PRO proteins, and proteins, and administration of a PRO proteins, and administration of strokens, mycardial infarction, bypertension, diabetic retinopathy, rheumatoid arthritis, Crohn's disease, bost stroke. PRO nucleic acids are additionally useful in the recombinant production of PRO proteins, a shybridisation probes to erreen libraries to isolate cDNA with sequence identity to PRO proteins, to analyse genetic disease, or stroke. PRO nucleic acids are additionally to PRO proteins, to enalyse genetic disease, or stroke. PRO proteins, to analyse genetic disease, and in gene therapeutic agents to an also be used to produce transgenic agents. The present sequence represents an enceding and additional and secure a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        anglogeni

The invention describes an isolated nucleic acid (1) comprising, or which has 80 % sequence identity to, or the full-length coding sequence of, one of 275 nucleotide sequences, and which encodes a corresponding cof 275 nucleotide selected from 275 amino acid sequences, where all sequences are given in the specification. The polypeptide encoded by (1) is used to detect PRO polypeptides, link a bioactive molecule to a cell expressing a PRO polypeptide, modulate a biological activity of a cell, stimulate the release of tumour necrosis factor (TNF)-alpha from human blood, modulate the uptake of glucose or free fatty acid by cells, stimulate or inhibit the uptake of glucose or free fatty acid by cells or gene expression, stimulate the release of proteoglycans, stimulate the release of glucose or free fatty acid by cells or gene expression, stimulate the release of proteoglycans, stimulate the release of proteoglycans, cells, inhibit the binding of A-peptide to factor VIIA, or detect the presence of tumour in a mammal. The nucleic acid and polypeptide encoded by it, are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, acquired immunodeficiency syndrome birth defects, premature aging, acquired immunodeficiency bybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing. This is the amino acid sequence of a novel human secreted and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Zhang
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New secreted and transmembrane PRO nucleic acids, for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, axquired immunodes syndrome (AIDS), or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Filvaroff E,

```

The present invention relates to the isolation of novel human PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful for preparing a medicament useful in the treatment of diabetes, bone and/or cartilage disorders (e.g. rheumatoid arthritis, sports injuries, osteoarthritis), obesity, hyper- or hypo-insulinaemia, hearing loss, and coagulation disorders (e.g. stroke, heart attack). Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific cells, tissues or cartural sources. ABU80870-ABU81144 represent the human PRO or natural sources invention. Note: The sequence data for this patent was obtained in electronic format directly from the USPTO web site at sequence.
